

CAD, GIS & Remote Sensing

Drawings, maps and satellite data · Equigrow short notes

CAD drafting

- Commands: LINE, PLINE, OFFSET, TRIM, EXTEND, HATCH, DIMENSION.
- Use layers for walls, dimensions and text; set units and scale first.

GIS basics

- Vector data = points, lines, polygons. Raster data = grids of cells (images, elevation).
- Always check the coordinate reference system (CRS) matches across layers.

Remote sensing

- Satellites record reflected light in bands (red, green, blue, near-infrared).
- NDVI = $(\text{NIR} - \text{Red}) / (\text{NIR} + \text{Red})$: higher means healthier vegetation.
- Google Earth Engine lets you analyse years of satellite images in the browser.
