

Docker

Package apps so they run anywhere · Equigrow short notes

Key ideas

- An **image** is the recipe (built from a Dockerfile). A **container** is a running copy of it.
- Containers make "works on my machine" work everywhere.

Dockerfile

```
FROM python:3.12-slim
WORKDIR /app
COPY requirements.txt .
RUN pip install -r requirements.txt
COPY . .
CMD ["python", "app.py"]
```

Commands

```
docker build -t myapp .
docker run -p 8000:8000 myapp
docker ps                docker logs <id>          docker stop <id>
docker images            docker compose up -d    # start several services
```
