

# Edge Impulse

TinyML: AI on microcontrollers · Equigrow short notes

## Workflow

- Collect data (from a phone or a supported board) → design an impulse (processing block + learning block) → train → test → deploy as a library or firmware.

## Good first projects

- Keyword spotting ("on" / "off"), gesture recognition with an accelerometer, simple image classification.

## Tips

- Collect data in the real conditions where the device will run.
- Check the on-device performance numbers (latency, RAM, flash) before deploying.
