

R

Statistics and data analysis · Equigrow short notes

Basics

```
x <- c(4, 8, 15, 16)      # vector
mean(x); sd(x); summary(x)
df <- read.csv("data.csv")
head(df); str(df)
df[df$cgpa > 8, ]         # filter rows
```

tidyverse

```
library(dplyr); library(ggplot2)
df %>% group_by(branch) %>% summarise(avg = mean(cgpa))
ggplot(df, aes(x = hours, y = cgpa)) + geom_point()
```

Tips

- Use `RStudio::install.packages("dplyr")` installs a package once; `library(dplyr)` loads it each session.
