

React

Build user interfaces with components · Equigrow short notes

Components & props

```
function Card({ title, children }) {  
  return <div className="card"><h3>{title}</h3>{children}</div>;  
}
```

```
<Card title="Hello">Welcome to React</Card>
```

A component is a function that returns JSX. Props are its inputs (read-only).

State & events

```
import { useState } from "react";  
function Counter() {  
  const [count, setCount] = useState(0);  
  return <button onClick={() => setCount(count + 1)}>Clicked {count}</button>;  
}
```

Changing state re-renders the component. Never change state directly; always use the setter.

Effects & lists

```
useEffect(() => {  
  fetch("/api/items").then(r => r.json()).then(setItems);  
}, []); // [] = run once after the first render  
  
{items.map(item => <li key={item.id}>{item.name}</li>)}
```

- Every list item needs a stable, unique **key**.
- Lift state up to the closest common parent when two components need it.

Project setup

```
npm create vite@latest my-app -- --template react  
cd my-app && npm install && npm run dev
```
